ABSTRACT

In the modern digital era, recruitment processes in the education sector often remain inefficient, unorganized, and time-consuming due to the continued reliance on traditional hiring methods. Teachers face difficulties in identifying suitable job opportunities, while educational institutions struggle to manage applications and identify qualified candidates efficiently. To address these challenges, this project proposes **Teacher World**, a centralized web-based recruitment platform designed exclusively for connecting teachers with colleges and educational institutions.

Teacher World provides a unified portal where teachers can create secure digital profiles highlighting their academic qualifications, teaching experience, subject expertise, and preferred job locations. Through authenticated access, teachers can search and apply for job vacancies using advanced filters such as department, subject specialization, location, and employment type. Educational institutions can post vacancies, manage applications, shortlist candidates, and track recruitment progress using an integrated Application Tracking System (ATS).

The platform is developed using the **MERN Stack**, ensuring scalability, data security, and efficient performance. Real-time communication features and role-based authentication enhance interaction and transparency between teachers and institutions. By digitalizing and automating the recruitment workflow, Teacher World reduces administrative workload, improves accessibility, and ensures a structured and transparent hiring process. The system serves as an effective digital solution that modernizes teacher recruitment and supports efficient talent acquisition in the education sector.
